SUMMARY

Backend & AI Systems Engineer with 1.5+ years of full-time experience building scalable distributed systems, observability platforms, and LLM-driven automation at OpenText. Strong in Problem solving, System design, performance optimization, and intelligent infrastructure.

EXPERIENCE

OpenText

Associate Software Engineer

Bangalore, India

Oct 2024 – Present

- Redesigned UUID storage technique for cloud connectivity services, scaling supported inter-region connections from 55 to 165 (3×) without requiring schema changes.
- Built time-series data services with adaptive query routing between raw and pre-aggregated tables, significantly reducing query latency and improving system performance.
- Designed and implemented automated CVE ingestion and remediation pipeline integrating vendor advisories with network automation workflows, reducing manual vulnerability triage effort by 70–80%.
- Developed internal LLM-powered tools including an AI-assisted CLI and Text-to-SQL system, accelerating debugging and operational workflows.
- Operated across containerized distributed environments using Docker, Kubernetes, and Helm, contributing to reliable service deployment and scaling.
- Recognized by senior leadership (VP, Directors) for delivering high-impact features in AI-driven automation and customer-facing demos.

Engineering Intern

Apr 2024 – Sept 2024

- Built a Python tool to automate extraction of license usage data via SQL queries and generate CSV reports for internal analysis.
- Improved visibility into product usage patterns, reducing manual effort in reporting workflows.

PROJECTS

- **Distributed Power Grid Attack Detection:** Generated IEEE Bus-30 datasets and trained ML models achieving 84% accuracy under adversarial conditions.
- **Medical Image Retrieval System:** Built embedding-based similarity search using PyTorch achieving 80% retrieval accuracy.

RESEARCH & EXPERIMENTS

- **Adaptive Compute-Efficient Learning:** Designed LSTM-based classifier with early-exit Transformer reducing compute cost by ~65%.
- **Dynamic Context Selection for RAG:** Reduced token usage by ~90% (125 → 13 avg tokens) while maintaining 100% accuracy and improving precision (0.11 → 0.98).

TECHNICAL SKILLS

Languages: Java, Python, Go, C++ SQL

Backend & Systems: Microservices, REST APIs, Distributed Systems, Time-Series Processing, Spring Boot

AI/ML: PyTorch, HuggingFace, LLMs, RAG, LangChain, Scikit-learn, LangGraph, FastMCP, FastAPI

Cloud & DevOps: Docker, Kubernetes, Helm, Linux, Git

EDUCATION

Anna University

B.E. Electronics & Communication Engineering

CGPA: 3.5/4.0

India

2020 – 2024
